

a) Light curves, $\eta_{\text{vis}} 1e-4$ (solid 2000 K, 0.2 s; dashed 3000 K, 0.8 s; dotted 4500 K, 0.4 s); triangles: delayed band peaks

b) Dilution of the flash in longer exposures (T0 3000 K)

c) Above-atmosphere limits vs exposure (illum 0.35, 8' from sunlit terrain, airmass 1.2; lines end where the background passes half full well)
